

TIGER'S PAW

The Tiger's Paw community is a master plan for a small, 11-acre site in a heavily preserved area. The large amount of existing vegetation on the site, in conjunction with the site's relative remote location from the nearest road, proved to be challenging in designing a master plan and access method that would respect the natural landscape while providing maximized value for the client's land.

The triangular site is laid out for 19 residential lots and oriented to views of landscape or water. Each home comes paired with a private dock space, the homes on the canal having direct access in the rear of their property. Hardscape design takes into consideration site circulation and points of interest on the site. Landscape improvements include a fountain island, natural buffer, and a small park with a golf putting green.
